

Technical Defect Report: TCH-001

Field	Details
Defect ID	TCH-001
Title	Absence of Syntax Validation for Email Input Fields (Login/Signup)
Severity	High
Priority	High
Status	New
Environment	Staging
Application URL	https://tichi-app-webapp-stage.web.app
Browser/OS	Google Chrome (Latest Version) / Windows 11

1. Description

The application's authentication modules lack essential client-side validation for the email address field. Currently, the system permits users to submit malformed strings—such as those missing the "@" symbol or a valid top-level domain—without interruption. This oversight allows invalid data to propagate through the authentication flow, resulting in corrupted user records and potential downstream failures in the backend database.

2. Pre-conditions

- User has cleared browser cache and cookies (or is using an Incognito window).
- User is currently on the login page:
[\[https://tichi-app-webapp-stage.web.app/login\]](https://tichi-app-webapp-stage.web.app/login)(<https://tichi-app-webapp-stage.web.app/login>).

3. Steps to Reproduce

1. Navigate to the Login page URL.
2. Locate the text field labeled "Email Address".
3. Input a syntactically incorrect string (e.g., [test_user_invalid](#) or [user@domain](#)) into the email field.
4. Click the "Continue" button.

4. Expected Result

The system should perform real-time syntax checking. Upon detecting an invalid format, a clear error message (e.g., "Please provide a valid email address") should appear, and the "Continue" button should remain disabled until the input is corrected.

5. Actual Result

The application accepts the invalid input without warning and successfully redirects the user to the "Details" configuration page, incorrectly treating the malformed string as a valid identifier.

6. Suggested Fix

Integrate robust Regex-based validation on the client-side email input component. The validation logic should enforce standard RFC compliance (e.g., `user@example.com`) and act as a gatekeeper for both the "Continue" button state and final form submission.
